

Switch

The only tool you need to play, inspect, QC and correct all your media

Everything you need in one application. Switch lets you play a variety of web and professional media formats, inspect and adjust the properties of the file and export a new file. Designed for media professionals, Switch enables visual file inspection, single file transcoding and is an affordable software solution for professional media Quality Control.

Play it

Trust Switch for frame-accurate, smooth playback of all your media files, including captions and subtitles. Switch supports high-quality playback for virtually all professional formats including MXF, GXF, DNxHD, JPEG2000, MPEG-2 Program Streams and Transport Streams and also formats like MOV and MP4. Switch can also play HEVC and 4K files. The player includes standard navigation controls including JKL, fast forward, rewind, slow motion. There is also single-frame forward and back for all file types - even transport streams.

Check it

Open the Switch inspector to view in-depth media information. Switch presents a well-organized display of container, video, audio and subtitle information. Check audio channels, speaker labels, aspect ratio, clean aperture, bitrate, frame rate, metadata, encoding formats and more. There's a fully featured audio meter panel where you can check your audio levels, solo or mute audio channels, and even monitor gated and ungated loudness levels. For professional QC workflows, you can preview your files with HDMI/SDI output via AJA video hardware products to a broadcast monitor or other device.

Fix it

Switch to edit mode to make changes to the file: specify a new file format; a new video or audio codec; trim, scale or crop the video; add metadata and insert chapter markers. You can even rearrange audio tracks and edit speaker assignments. Export support includes MPEG4, MOV, and MPEG-2 Transport and Program streams with Apple ProRes and H.264. Video and Audio pass-through mode allows you to make non-encoding-related changes to your media. Switch also contains a built-in packaging preset that lets you export and create an asset-only iTunes store package.
